

**A SYSTEMS AND METHODS FOR IDENTIFYING COMPLEX  
TEXT IN A PRESENTATION DATA STREAM**

**ABSTRACT**

5           Systems and methods of identifying and processing complex text are  
provided. If a presentation data stream contains a complex text string, a preselected  
control in the presentation data stream is inserted before the complex text string. A  
first parameter has a value indicating a control type for controlling processing of  
complex text, and a second parameter takes one or more values for enabling and  
10       disabling the processing of complex text. In processing complex text, responsive to a  
first predetermined type of control in a presentation data stream, if the first type of  
complex text processing is enabled, this processing is applied to a complex text string  
succeeding the first predetermined type of control in the presentation data stream.  
The first predetermined type of control includes a first parameter represented by a  
15       corresponding value for controlling the first type of complex text processing.
